## SW-16-v2

Version 2.0 - July 5, 2017

## General Description:

SW-16 boards are used to deliver switch state information in a pinball machine to a master device, such as a $\mathrm{P}^{3}$-ROC board, over an RS-485 serial bus.

## SW-16 Details:

The SW-16 has two banks of 8 switch inputs. Each input has a 6 v comparator circuit, which determines the state of the switch connected to the input. If the voltage is below 6 v , the state of the switch is ' 0 '. Otherwise the state of the switch is ' 1 '. Each input also has a pull-up resistor, forcing the state to ' 1 ' when nothing is connected to the input.

In addition to the switch input circuits, The SW-16 has a bidirectional RS-485 transceiver, 6 address dipswitches, and a complex programmable logic device (CPLD). The RS-485 transceiver converts RS-485 signals to digital logic signals (and vice versa) so the CPLD can communicate on the RS-485 bus. The CPLD responds to host-initiated commands when the command's address matches the value set on the 6 address dipswitches. The only commands currently supported are register read commands.

## Connectors:

| J1 | Power | Required |  |
| :---: | :--- | :---: | :---: |
| 3-pin Molex: 0.156" spacing |  |  |  |
| 1 | KEY | N/A |  |
| 2 | 12V | I |  |
| 3 | Ground | I |  |

| J2 | Bank A <br> Switch Inputs | Required if using <br> Bank A |
| :---: | :--- | :---: |
| 10-pin Molex: 0.100" spacing |  |  |
| 1 | 12V | O |
| 2 | Bank A - Switch 0 | I |
| 3 | Bank A - Switch 1 | I |
| 4 | Bank A - Switch 2 | I |
| 5 | Bank A - Switch 3 | I |
| 6 | Bank A - Switch 4 | I |
| 7 | Bank A - Switch 5 | I |
| 8 | Bank A - Switch 6 | I |
| 9 | Bank A - Switch 7 | I |
| 10 | Ground | O |

| J3 | Serial Data In | Required |  |
| :---: | :--- | :---: | :---: |
| 3-pin Molex: 0.100" spacing |  |  |  |
| 1 | Ground | I |  |
| 2 | Serial Data + | I |  |
| 3 | Serial Data - | I |  |

| J4 | Serial Data Out | Not Required |
| :---: | :--- | :---: |
| 3-pin Molex: 0.100" spacing |  |  |
| $\mathbf{1}$ | Ground | 0 |
| 2 | Serial Data + | 0 |
| 3 | Serial Data - | 0 |

| J6 | Bank B <br> Switch Inputs | Required if using <br> Bank B |
| :---: | :--- | :---: |
| 10-pin Molex: 0.100" spacing |  |  |
| 1 | 12V | O |
| 2 | Bank B - Switch 0 | I |

| 3 | Bank B - Switch 1 | N/A |
| :---: | :--- | :---: |
| 4 | Bank B - Switch 2 | I |
| 5 | Bank B - Switch 3 | I |
| 6 | Bank B - Switch 4 | I |
| 7 | Bank B - Switch 5 | I |
| 8 | Bank B - Switch 6 | I |
| 9 | Bank B - Switch 7 | I |
| 10 | Ground | O |

## Addressing:

In order to receive the correct data from the P-ROC, each board's address needs to be set appropriately. The following table describes how to use the dipswitches to set the board address:

| Dipswitch | Meaning |
| :---: | :---: |
| 1 | Address bit 0* |
| 2 | Address bit 1* |
| 3 | Address bit 2* |
| 4 | Address bit 3* |
| 5 | Address bit 4* |
| 6 | Address bit 5* |
| 7 | ID bit 5 |

*On=1, Off=0

## Board ID:

The board ID is a value that can be read by software, and it is configurable via the following dipswitch and resistor placement options:

| ID bit | Resistor (for 0/1) |
| :---: | :---: |
| 0 | R84 / R90 |
| 1 | R86 / R91 |
| 2 | R87 / R92 |
| 3 | R88 / R93 |
| 4 | R89 / R94 |

## Serial Chain Termination:

The last board in the physical chain (not necessarily the highest address) needs to be set to terminate the serial chain. This is done by setting dipswitch 8 on.

## Status LEDs:

| LED | Meaning |
| :---: | :---: |
| D5 | 12 V |
| D6 | 3.3 V |
| D8 | CPLD Operational |

## Dipswitches:

| Switch | Meaning* |
| :---: | :---: |
| 1 | Address bit 0 |
| 2 | Address bit 1 |
| 3 | Address bit 2 |
| 4 | Address bit 3 |
| 5 | Address bit 4 |
| 6 | Address bit 5 |
| 7 | ID bit 5 |
| 8 | Terminate serial bus |

$\mathrm{On}=1, \mathrm{Off}=0$

## Registers:

| Device Type | Address 0x0 |  |
| :---: | :---: | :---: |
| Bits | Field | Default |
| $7: 0$ | Device Type | $0 \times A 3$ |

| Board ID |  | Address 0x1 |
| :---: | :---: | :---: |
| Bits | Field | Default |
| $7: 0$ | Board ID (configurable - see Board ID section above) | N/A |

| Bank A Switches |  | Address 0x2 |
| :---: | :---: | :---: |
| Bits | Field | Default |
| $7: 0$ | Board A Switch States | 0xFF |

| Bank B Switches |  | Address 0x3 |
| :---: | :--- | :---: |
| Bits | Field | Default |
| $7: 0$ | Board B Switch States | $0 x F F$ |

## Example Usage:

*Power for the transmitter in an opto switch need not be the same power that powers the SW-16 board. Opto transmitters typically require incoming current to be limited with an appropriately sized resistor.

## Getting Started:

## Hardware

- Mount the board using the 4 mounting holes (M3 or 4-40 screws).
- Connect a 12 V supply to J1.
- Connect J3 to the previous board in your chain using a 2 -wire cable. If the boards are separated by more than a few feet, a shielded \& twisted pair is recommended. For short runs, any 2-wire cable should suffice.
- If using Bank $A$ :
- Connect your Bank A switches to J2.
- If using Bank B:
- Connect your Bank B switches to J6.

## Software

- If using a P3-ROC:
- Once configured, the P3-ROC can automatically scan the SW-16 board for switch state changes. Switches map to P3-ROC switch numbers according to the following equations:
- Bank A switch: P3-ROC switch \# = SW-16 address * 16 + Bank A switch input \#
- Bank B switch: P3-ROC switch \# = SW-16 address * $16+8$ + Bank B switch input \#
- SW-16 registers can also be read directly from software. Refer to the P3-ROC FPGA Specifications for more details.
